

# SUJAL Kulshrestha

Section :- P (P2) Roll No :- 47

## POINTS CLEARED

- ✓ Write a PHP program that creates a file and write contents to it.
- ✓ After closing the file, reopen it and append some data to it.

## MODULE LEARNED

- Use of file handling in PHP.
- Use of fwrite(), fclose() and fopen() functions in PHP.
- How to link the file path and the method we are using write, append or read.

## EXPLANATION

---

Here I created a PHP file named as Write&Append.php and opened it with write mode and write content "hello world !!".

After closing the file I again re-opened the file using append mode and write content,

My name is Sujal Kulshreshtha.  
My section is P (P2).

To execute the program I opened the PHP file and the file names 'W&A.txt' is created afterwards, with contents written to it as,

Hello World !!  
My name is Sujal Kulshrestha.  
My section is P (P2).

## PHP Code

```
<?php
    // Created a file in write mode !!
    $file = fopen("W&A.txt", 'w');
    fwrite($file, "Hello World !!\n");
    fclose($file);
    // Opened File again with append mode !!
    $file = fopen("W&A.txt", 'a');
    fwrite($file, "My name is Sujal Kulshrestha.\n");
    fwrite($file, "My section is P (P2).\n");
    fclose($file);
?>
```

## OUTPUT
